AN BOUNDARY DISPUTE.

1 A bill may be introduced into the Senate or into the House of Representatives by placing it in a hopper on the clerk's table.

2 The bill is then sent to a committee for consideration. Here it is studied, together with related material provided by proponents and opponents.

3 If the committee approves the bill is killed. If the committee votes to become a law, it is reported out. Public hearings, which may last many days, are held for important bills.

4 Also, the committee may amend the bill or rewrite it on the basis of information provided by hearings.

5 After discussing the bill the committee takes action either by reporting the bill out favorably, perhaps with amendments, or by tabling it.

6 A bill receives three readings. The committee report is heard before the second reading of the bill.

7 The bill is then debated by the house where it was introduced. Here it may receive additional amendments. Because of the large number of bills, not all reach the stage of debate.

8 If the bill passes, it is sent to the other house. If the bill is amended there, it is sent to a conference committee of the two houses in order to work out a compromise.

9 If both houses pass the bill in the same form, it is then signed by the presiding officers of both houses and sent to the president.

10 If the president signs the bill, then it becomes a law, and the great seal of the United States is affixed to it. However, if the president vetoes the bill, it is returned to Congress.

11 After the vetoed bill has been returned to Congress, it is reconsidered. If two-thirds of both houses approve the bill, it becomes law despite the veto of the president.

12 A bill also becomes law if the president keeps it ten days without signing it. But if Congress adjourns before the ten days expire, the unsigned bill dies. This is a pocket veto. The president's veto power is a safeguard against ill-considered legislation.

A piece of legislation may go through many steps in the U.S. Congress before it becomes law. The illustrations above show these steps.

BILL, the draft of a proposed law presented for consideration by a legislative body. In the legislature of the United States, a bill, once introduced, may be considered in any session of Congress. If that Congress does not pass the bill, it dies at the end of the Congress. If a new Congress is to consider the bill, it must be reintroduced as a new bill. Bills for raising revenue must originate in the House of Representatives. By usage, bills of appropriation also originate in the House of Representatives.

BILLIARDS, any of several games played on a table covered with cloth that is enclosed by a leather-tipped, tapering wooden rod called a cue.

A crude form of billiards was played by the ancient Egyptians and Greeks. Although the modern game probably originated in England during the 15th century after an attempt was made to bring bowling indoors, it was in France that the game received its name and its first popularity. Billiards was carried to the New World in 1565 by the Spaniards who settled St. Augustine in Florida. George Washington, Thomas Jefferson, and Alexander Hamilton were all fond of the game and played it frequently. The first public match to which an admission was charged was played in New York in 1807. Today organized competition takes place on amateur, intercollegiate, and professional levels. Of special interest are the national and international contests held to determine the champions of the various types of billiard games. Among the recognized masters of the modern game were Willie Hoppe, Charles C. Peterson, Welker

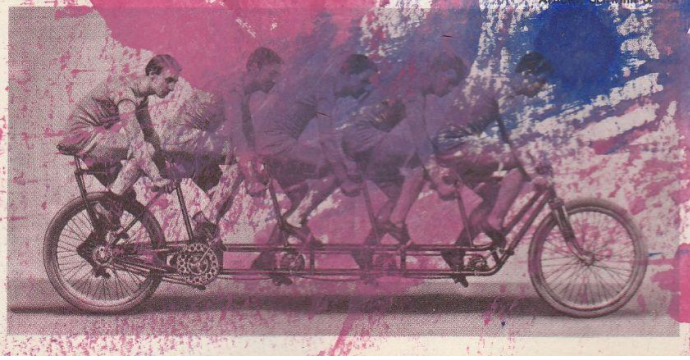
Hints on Bicycle Safety

This quintet is a racing team on a "quintuplet" (a bicycle for five). The year was 1[illegible]. Aboard are twins, a [illegible]



his feet. Pedals for the front wheel were not invented until many years later, and it was even later that the first bicycle with rubber tires and all-metal parts was made. Because a large pedal wheel would make the bicycle go faster, the front wheel was made bigger and bigger until it was 5 feet high; the rear wheel was only 1½ feet high. This put the rider high in the air, and he was very likely to tip forward if he stopped suddenly or hit a bump.

After years of popularity this bicycle, an "ordinary," was outmoded by the invention of chain drive. The pedals turned only a large toothed sprocket, and a small sprocket turned with the axle of the rear wheel. A chain fitting around the teeth of both sprockets converted the slow turning of the pedal sprocket into fast turning of the rear-wheel sprocket. This made fast speeds possible without fast pedaling, just as the large front wheel had done, but now the wheels could be the same size, making the bicycle much safer. This safety bicycle replaced the ordinary by 1895. About that same time tires inflated by air pressure were developed, and the modern bicycle was nearly complete. Later, coaster brakes, hand brakes, two-speed and three-speed gearshifts, electric headlights, and other improvements were added.

BICYCLING. See CYCLING.

Biela's Comet, not seen since it returned as a double comet in 1852, travels around the sun in the elliptical orbit shown here. The comet disintegrated into a meteor swarm.

BIELA'S COMET. You will never be able to see this comet because it disappeared in 1852. The comet is still famous over 100 years later because of the way it disappeared and what probably became of it.

antee that they would never be deprived of this equality without their consent.

Bicameralism has also dominated

—where it is firmly established—but also in the state governments. This is partly the result of the English precedent and also of a major compromise of the Constitutional Convention of 1787. In this convention it was agreed that the number of representatives each state could send to each of the two houses of Congress should be proportional to the state's population. Large states like Virginia and New York, however, would have many more representatives than the small states, like New Jersey and Maryland. In order not to be placed at the mercy of the big states, the small states won equality of representation in the Senate but accepted almost all of the municipal legislative bodies within the United States had been organized unicamerally. See MUCKRAKERS.

BICYCLE, a vehicle with only two wheels, one in front of the other, connected by a frame. Standing still without support it falls over, but in motion it easily stays upright with the help of a rider's sense of balance and a slight amount of steering.

Considering the thousands of years the wheel and axle have been known, it is surprising to learn that the first bicycle was not invented until after 1800. It was just a seat on a frame between two wheels. There were no pedals or brakes.

Wilhelm von Biela discovered it in 1826 and found that it was traveling around the sun in 6¾ years, not going much beyond the orbit of Jupiter at its farthest point. The comet had been seen twice before, but no orbit could be computed for it at those times.

When the comet appeared on schedule in 1845, to everyone's amazement it broke in two. The two parts returned in 1852 as expected, but they were much fainter and over one million miles apart. The next appearance was too close to the sun for observation, and in 1872 the comet did not appear at all. Instead there was a brilliant meteor shower, traced to the same orbit as the lost comet. Regular meteor showers since then have been traced to the comet's orbit. They are called Andromedids, or Bielids. Some of them may well be the remnants of the old comet. The meteor swarm has apparently shifted largely out of the path of the earth's orbit, for the meteor showers have now become quite small.

BIENNIAL PLANT. See PLANT, ANNUAL, BIENNIAL, AND PERENNIAL.

BIENVILLE, JEAN BAPTISTE LE MOYNE, SIEUR DE (1680-1768), a French-Canadian nobleman who was three times governor of Louisiana, founded Mobile and New Orleans, and promulgated the black code.

Bienville was born in Longueuil, near Montreal, Canada, the eighth son of Charles le Moyne. The Le Moynes distinguished themselves as representatives of the French kings in the New World. Jean Baptiste inherited the title sieur de Bienville from a brother who was killed in the Iroquois wars.

In 1698 Bienville accompanied his brother Pierre, sieur de Iberville, who headed an expedition to the mouth of the Mississippi River. The French governors of Canada encouraged the exploration of the Mississippi Valley and the founding of French colonies there. Iberville founded a small colony at Biloxi and left Bienville second in command. From the time of his arrival Bienville was engaged in exploration and in negotiations with the Indians. Succeeding to the governorship, Bienville was also commissioned as the king's lieutenant and built Fort Louis on Mobile Bay. In 1710 the headquarters of the colony were moved to the site of present Mobile.

Between 1712 and 1717 the French king granted Louisiana to a trading company, and Bienville was replaced by another governor. But he was reinstated in 1718 by the reckless financier John Law, who plunged France and England into the financial chaos known as the Mississippi Bubble. Bienville founded New Orleans in 1718 and made it the capital in 1722. He also promulgated the black code, issued by the king of France, in 1724. This code fixed the legal status of the Negro slaves in Louisiana and imposed certain obligations on their masters. In the same year Bienville was deprived of the governorship and recalled to Paris. In 1733, however, he was sent back to Louisiana to placate the rebellious Indians, especially the Natchez and the Yazoo, who had begun to trade with the English. Bienville fought indecisive wars against the Indians and then retired from the governorship in 1743, never to return to Louisiana.

BIG BEND NATIONAL PARK has spectacular mountain and desert scenery. It encloses in the great U-shaped bend of the Rio Grande. The park, located in the extreme western part of Texas, is on the Mexican border. It covers more than 1,000 square miles and was established in 1944.

The park has many con[illegible] Mountain ranges, broad valleys, deserts, and spectacular canyons are results of the action of geological forces. The animal and plant life is more characteristic of Mexico than of the better known parts of the United States. One of the most unusual animals is the wild hog, or javelina.

Prehistoric Indians once lived here. Numerous remains have been found in dry caves and rock shelters. Apache Indians, Spanish conquistadors, and missionaries also were active in the area.

BIG-GAME HUNTING. The term "big game" refers to wild, four-footed animals that are killed with high-powered rifles. Big-game animals include the elephant, buffalo, rhinoceros, lion, leopard, bear, [illegible] larger members of the deer and antelope family.

Big-game hunting was a favorite sport of kings and nobles from the earliest times. Assyrian, Babylonian, Egyptian, and other ancient sculptures and paintings show scenes of big-game hunts with bow and arrow and spear. The men are usually shown hunting from chariots or on horseback. In the Middle Ages the kings and their courts in Europe organized boar and bear hunts, and

Big Bend National Park contains traces of old volcanic activity. Some of these traces are noticeable here in the rimrock of the Chisos Mountains, one of the area's chief mountain ranges.

proportion of heads is one-half, although other proportions are still possible but have a lower probability. However, if the number of tosses increases toward infinity, the likelihood that the proportion of heads will be exactly one-half does not approach certainty. Bernoulli's theorem states instead that as the number of tosses increases toward infinity, it becomes increasingly certain only that the proportion of heads will be within a certain range of one-half. To state this in general mathematical terms, let p stand for the probability that an event will occur, let t stand for the number of opportunities for it to occur, let s stand for the actual number of times [illegible] stan[illegible]

The valuable emerald is deep-green beryl.

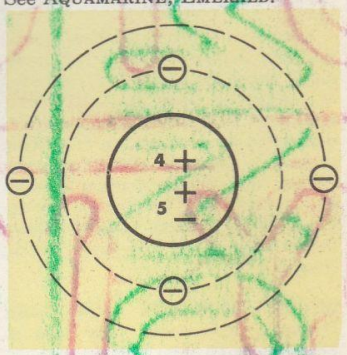
Beryl

Deep-green beryls are called emeralds and are valuable gem stones. A good emerald may be of more value than a diamond. Pale greenish-blue transparent beryls are aquamarines.

Beryl is a very hard mineral and has a hardness of 8. It is much harder than quartz.

Beryl is a rather common mineral and is found in many rocks. It is found in pegmatites, granitic rocks, and some schists and other metamorphic rocks. The chief source of emeralds is Colombia. Another locality famous for its emeralds is in Siberia. Aquamarines of gem quality are found in Brazil, Siberia, and Madagascar. In the United States beryl is found in New England, North Carolina, Colorado, the Black Hills of South Dakota, and other places.

Beryl is the principal ore of the metal beryllium. Beryllium is chiefly used to make an alloy of copper. See AQUAMARINE; EMERALD.



A beryllium atom (atomic number 4, atomic weight 9) has a nucleus containing 4 protons (+) and 5 neutrons. Its second, and outer, shell contains only 2 electrons (−).

BERYLLIUM is the element of least atomic weight in the alkaline-earth metals group of the periodic system. Its atomic number is 4, its atomic weight is 9, and its symbol is Be. Beryllium has unusual properties. Unlike other alkaline-earth metals, it can form covalent bonds with nonmetallic elements. It is harder than other alkaline earth metals, has a higher melting point, is the least dense of the group, and is the least active. Beryllium ions are the smallest of all metallic ions.

The mineral beryl is the chief source of beryllium. Beryl is mined in North America, South America, Africa, and India.

Beryllium is much used in copper-beryllium and nickel-beryllium alloys. Beryllium-containing alloys

are hard and tough, withstand vibration, can be made into long-wearing springs, and are more resistant to corrosion than is stainless steel. Because of their resistance to corrosion, alloys containing beryl-

city to a shambles. West Berlin, allied with the German government in Bonn, was supported by, and rebuilt with the help of, the United States, Great Britain, and France. There are scores of new buildings. Streets are crowded with traffic; there are [illegible] with ample food, and stores with full stocks of merchandise. In East Berlin, under Soviet control, there are more ruins, less traffic, fewer goods, and higher prices.

Two villages, Kölln and Berlin, originally stood where the city now is. They were united in the early 1300's. As they grew larger, the name Berlin was given to both be[illegible]s too much

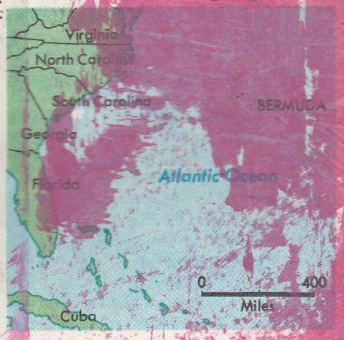
with chorus *Romeo and Juliet*, the concert opera *The Damnation of Faust*, the Christmas oratorio *The Childhood of Christ*, and the mammoth opera *The Trojans*—demonstrate his power and originality and his always brilliant orchestration, at which he is recognized as one of the greatest masters. In many of his other works he was less successful.

BERMUDA is a British colony made up of a group of some 300 small coral islands, 20 of which are inhabited. The mild climate and tropical scenery of the islands make them a popular winter resort. Bermuda lies in the west Atlantic about 580 miles southeast of Cape Hatteras, North Carolina. Its capital and largest town, Hamilton, is situated on Bermuda Island, which lies in the center of the group. There are more than 40,000 inhabitants of Bermuda, and over half of them are Negro.

Originally, tobacco was the chief export of Bermuda, but tobacco cultivation declined during the 18th century. Easter lilies are now among its chief exports, but tourist trade provides most of the income of the colony.

The islands were first visited by the Spanish early in the 16th century. They received their name from Juan Bermudez, who was shipwrecked among them. In 1609 George Somers, an Englishman, made the first settlement in Bermuda when he and a group of colonists were shipwrecked there. The British crown took over Bermuda in 1684 and has ruled it ever since. The government of the island is now semirepresentative.

In 1940 the British granted the United States a 99-year lease to air and naval bases on the islands.



BERN, the capital of Switzerland, in the west-central part of the country, on the Aar River. The old central part of the city stands on a bluff 180 feet high, surrounded on three sides by the river. The city's population is about 160,900, approximately the size of Sacramento, Calif. Bern contains many medieval fountains, towers, and arcaded streets. The famous Clock Tower, dating from 1530, has a clock with mechanical

until her
ath, was also an accomplished painter and sculptor. In addition
she wrote poetry and plays.

BERNOULLI'S THEOREM, the law of large numbers, a mathematical idea about probability, was first
ublished in 1713 afte
the death of its originator, Jakob Bernoulli. It has become a basic theorem in statistics, although its validity has been questioned.

Bernou
in how
h theo-
e same
nce, in
proba-
a single
et if a
actually tossed ten times,
result may not be five heads and five tails, but perhaps six heads and four tails or even all heads. What intrigued Bernoulli was the question, What would happen to the distribution of
s and tails if a coin were tossed
sands or millions of times? Out of a
usand tosses would the number of heads be close to one-half the tosses? Out of a million tosses would heads occur closer to exactly one-half the tosses than it would in only a thousand tosses? If the coin were tossed an infinite number of times, what would happen? Would the number of heads approach exactly one-half as the number of tosses increased toward infinity?

Bernoulli considered this question for 20 years before he gave his conclusion. He stated that in a large number of tosses the most probable

the sorrowful lament of his people. Interspersed in the poem are numerous references to other characters and brief accounts of other episodes in Germanic mythology. These allusions, all of which were readily understood by the poet's audience, emphasize Beowulf's greatness by contrasting him with others and also heighten the tragic atmosphere of the poem by furnishing sober reminders of the hero's impending doom.

The deep Germanic roots of *Beowulf* are emphasized by its setting being Scandinavia rather than England and by the essentially pagan outlook of the work, an outlook that persisted, although the Anglo-Saxons had been converted to Christianity over a century earlier.

Beowulf was intended to be chanted rather than silently read. The performer emphasized the rhythm of the poem by accompanying himself on a small instrument resembling a harp. Each line is divided into two parts, and each part contains two strong beats. There are no rhymes; alliteration (repetitions of the same sound) and a strong rhythm are the principal poetic devices. These characteristics are well illustrated in the closing lines of the poem:

Cwædon þæt hē wære wyruld-cyninga,
manna mildust, ond mon-þwærust,
lēodum liðost, ond lof-geornost.

("They said that he was among earthly kings the mildest of men and the gentlest, the kindest to his people and the most eager for fame.")

BERENICE'S HAIR (constellation). See COMA BERENICES.

BERG, ALBAN (1885-1935), an Austrian composer, was born at Vienna. He early showed his musical talent, his first songs being written in 1900. Four years later he met Arnold Schönberg, who was then teaching in Vienna. Schönberg was a great influence on Berg. In 1913 Berg's first orchestral works were performed under Schönberg's direction, and a riot broke out in the audience, cutting short the concert.

Berg saw service in World War I, and during this time he worked on his opera *Wozzeck*, based upon the play by Georg Büchner. The premiere of this work was given in Berlin in 1925 and created a sensation. In 1928 he began work on a new opera, *Lulu*. This work was unfinished at the time of the composer's death. In its unfinished form it was first performed in 1937. Berg also is noted for his Violin Concerto and for his chamber music.

BERIBERI is a disease occurring chiefly in oriental nations, where the diet is composed mainly of rice. Sailors and poor landsmen have been victims of the disease. It takes a variety of forms, but the characteristic symptoms are general paralysis and wasting away of the muscles. It is known as the B_1 vitamin-deficiency disease. Experimentally, the condition has been shown to be caused by a limited diet of polished rice, rice from which the outer layers of the grains have been removed. If the polishings are restored to the diet, the disease disappears. If such materials as meat and barley are added to the polished rice, the disease does not occur. Such foods as whole wheat, brown (unhulled) rice, and especially brewer's yeast and wheat germ are rich in vitamin B_1, or thiamine, the antineuritic vitamin. This vitamin protects the nerve tissue against degeneration and prevents beriberi.

BERING, VITUS (1680-1741), a Danish explorer, was born in Jutland. After making several voyages to the East and West Indies, he entered the service of Russia while still a young man. By 1722 he was a captain commander.

Catherine the Great put him in charge of an expedition that was sent to determine whether Asia and America were united. He discovered, in 1728, that Asia was not joined to America. He found that the two continents were divided by a strait about 50 miles wide, which connected the Pacific and Arctic oceans. This strait is now known as the Bering Strait, and the sea between it and the Aleutian Islands is called the Bering Sea. In 1741 Bering was shipwrecked on an island in the Bering Sea and died there that same year. The island is also named after him.

The route of Vitus Bering in his five-year expedition across the mainland and along the coast of Russia is shown in this old Russian map made in 1735. Bering built his boat, *St. Gabriel*, at Kamchatka (labeled "Chamscatka") and sailed north, exploring the coast.

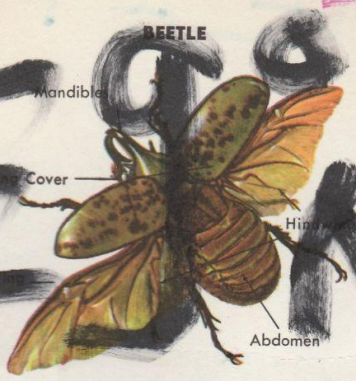
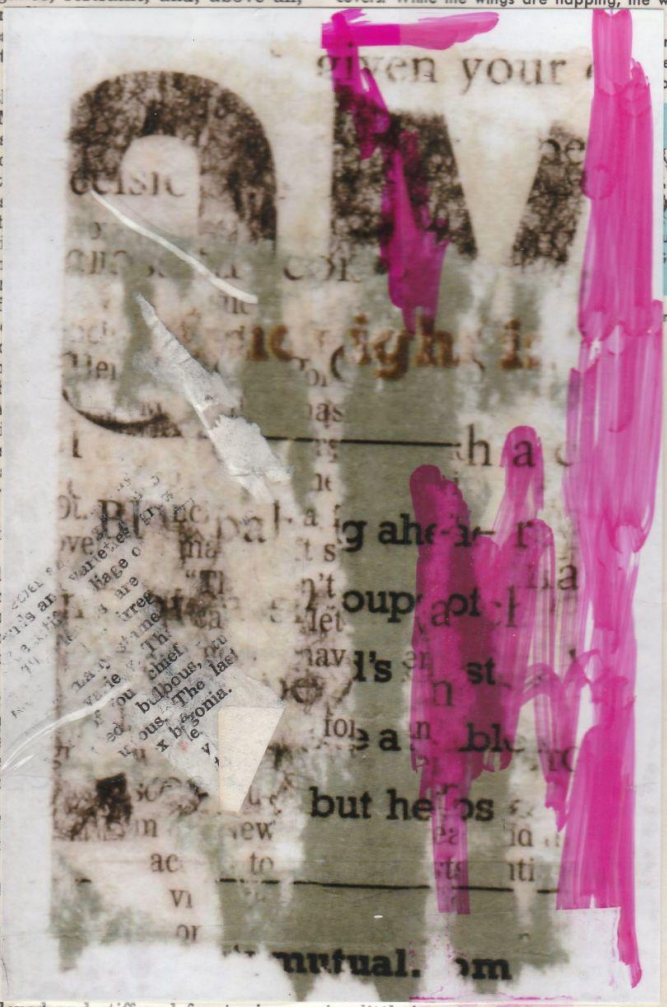
BEETLE



The external anatomy of a beetle is shown above. When the wings are folded against the body, they are concealed by two thick, leathery covers. While the wings are flapping, the wing

When he was about 28 years old Beethoven became aware that he was losing his hearing. Four years later, in 1802, he wrote the famous "Heiligenstadt Testament," a letter to his brothers in which he revealed that in despair over his growing deafness he was on the verge of suicide. He managed, however, to overcome this despair and went on to write some of the most inspiring music ever written, much of it after he had become totally deaf.

Beethoven is generally considered to be the central figure in the history of music; the significance of his contribution is almost beyond calculation. Music before him, best exemplified by that of Mozart, had been characterized principally by grace, elegance, restraint, and, above all, form



hardened and stiffened front wings ing little insects.

The Japanese beetle is a fruit pest. Larvae of the caterpillar hunter beetle eat caterpillars. The billbug injures grain roots. The striped cucumber beetle eats cucumber leaves. Larvae of the darkling and meal worm beetles damage stored grain. Whirligig beetles, water scavenger beetles, and predaceous diving beetles inhabit ponds. The striped potato beetle and the Colorado potato beetle are pests of potato plants. The relatively large ox beetle and rhinoceros beetle remotely suggest their namesakes. The dung beetle and the tumblebug make dung balls and roll them about. The six-spotted tiger beetle moves swiftly. The wingless female of the tile-horned Prionus bear overlapping plates. The hairy burying beetle, the hairy rove beetle, and the carrion beetle eat decaying animal flesh. Larvae of the elder borer burrow into trees. Larvae of the Buffalo carpet beetle eat and damage wool. If the eyed elater falls on its back, it can flip into the air, turn over, and land normally on its legs.

BAUXITE (from Les Baux, the name of a town in the south of France where it was first found in large quantities) is a whitish-gray clay that is the chief commercial source of aluminum. The bauxite found in nature is more than half alumina, or aluminum oxide. Its other constituents are water, iron, and silica. The difficulty, for many years, was to get the aluminum free from the ore as alumina has a very high melting point (over 2,000° C.), so that it cannot be melted in iron or steel tanks; moreover, it cannot be dissolved by any ordinary reagent.

The American chemist Charles Martin Hall, who invented the Hall process for reducing bauxite and so made cheap aluminum possible, discovered that cryolite, a double salt of aluminum and sodium found in Greenland but now produced synthetically, has the unique property of dissolving bauxite at a comparatively low temperature. See ALUMINUM.

Bauxite is also used in the manufacture of alum and alundum. It is found in several districts of the United States, but principally in Arkansas.

BAVARIA is a former kingdom of southern Germany. It is now a state of West Germany. It is a hilly land with some high mountains and large forests. Germany's highest mountain, the Zugspitze, is in the Bavarian Alps. The principal river is the Danube.

The climate is cool. Winters are cold, and much snow falls in the highlands. Forests, composed chiefly of pine and fir trees, cover about one-third of the land. Rye, sugar beets, potatoes, barley, wheat, and hops are among the main crops grown by Bavarian farmers. Most of the people are Roman Catholics.

This town is located on the pine-covered slopes of the Bavarian Alps. The Bavarian Alps, which offer beautiful landscapes and winter sports, are a favorite vacation area for Germans and people from other nations. Bavaria is an agricultural region. About a third of the land is ...

In 1870 a woman's bathing costume consisted of a bodice, a full skirt, and bloomers that terminated in ruffles below the knees. High-heeled shoes and hose completely covered the lower extremities, and a hat adorned the head. In 1890 a skirt, long bloomers, and a hat were still worn, but they were somewhat simpler in style. By 1905 the hat and bloomers were outmoded, but knee-high hose still completely covered the legs. Ten years later women were bathing in a sleeveless, heavy-wool chemise extending from the neck to the knees. The diminutive costume of 1961 contrasts greatly with the earlier ones.

to wear a long, loose, flannel bathing chemise.

In the 1860's a costume appeared in which a little swimming was possible. This Victorian costume had an ankle-length skirt and looked like a lady's gown.

In 1887 many sports became popular. For bicycling and swimming costumes with large sleeves and full bloomers allowed freedom of movement. In 1900, although long stockings were still in use, the Victorian gowns were abbreviated. Bathing caps were worn, but they were made of fabric and were not meant for the water.

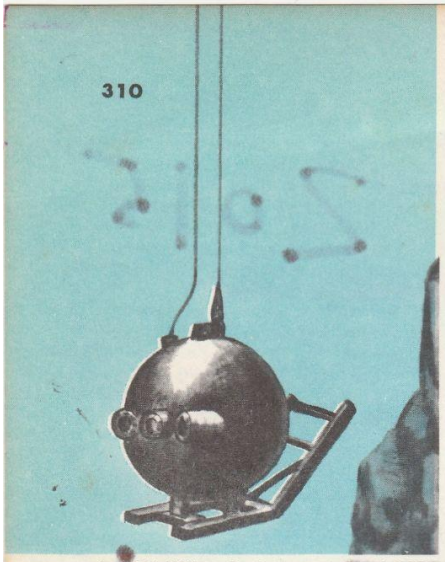
BATHOLITH, a very large igneous rock mass that formed beneath the surface of the earth. Parts of a batholith may be exposed at the earth's surface because the many layers of rock that once covered the batholith have been partially removed by erosion. Batholiths are often composed of granite to granodiorite and are associated with major mountain ranges. By definition a batholith has a surface area of 40 square miles or more. If the same type of rock mass has a surface area of less than 40 square miles, it is called a stock. Some geologists call any large igneous intrusive mass a pluton.

Batholiths are composed of coarse-grained rocks. Batholithic rocks are formed at high temperatures and cool very slowly. While a batholith is forming, the neighboring rocks, called wall rocks, may be greatly metamorphosed, and sometimes are penetrated by hot liquid rock from the batholith. It is probable that different batholiths have come into existence in somewhat different ways. But all batholiths were formed at fairly high temperatures and beneath the earth's surface.

Some batholiths are extremely large. The Coast Range batholith in British Columbia is at least

The exposed rock is part of a batholith. A large batholith located in central Idaho is exposed for over 16,000 square miles.



In 1934 William Beebe at a depth of 3,028 feet explored the ocean off Bermuda. At these dep see many fish with fanta mouths, large eyes, or lu

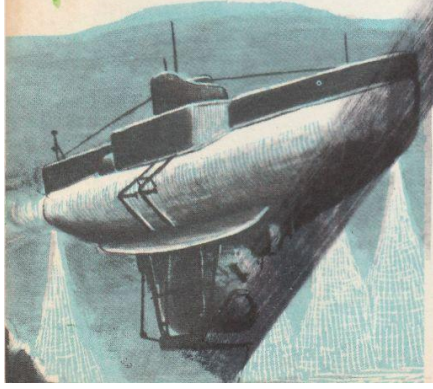
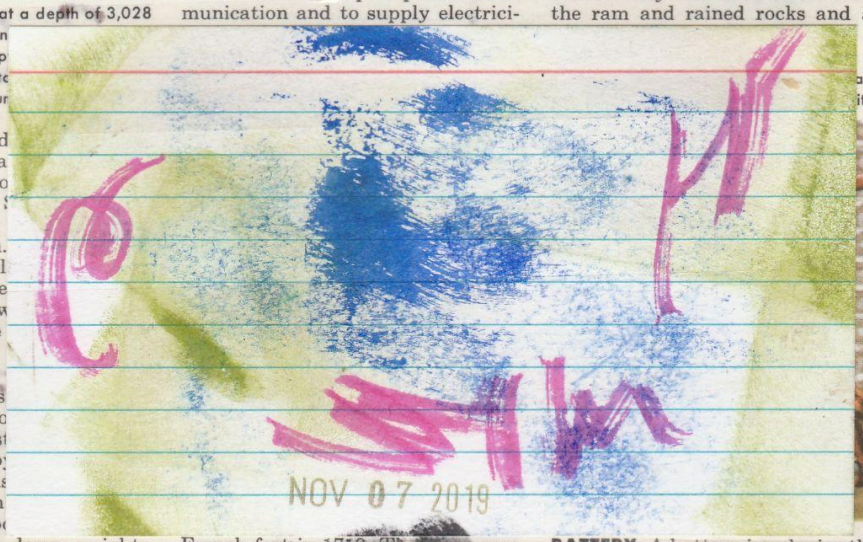
BATHYSCAPHE, a s deep-diving craft fo ploration. It consist sphere suspended b of light fluid such as operated in depth in lar to that of a ballo line is released to go down; weights are dropped to go up. Power for lights, propulsion, and special equipment is furnished by a storage battery. Auguste Piccard and his son Jacques are largely responsible for the successful development of this research vehicle.

In 1959 Andreas Rechnitzer and Jacques Piccard went down to 18,600 feet in a bathyscaphe in the Marianas Trench off Guam.



BATHYSPHERE, a spherical steel chamber with a quartz eyeport used for deep-sea observations. It has room enough inside for two persons with lights, cameras, and other equipment for recording data. The bathysphere was designed by naturalist William Beebe and Otis Barton. Beebe reached a depth of 3,028 feet off Bermuda with this device. Modern steels enabled the U.S. Navy to reach a depth of 38,500 feet in 1960. Oxygen for breathing is carried, together with special chemicals to remove carbon dioxide and moisture from the breath.

The bathysphere may be supported by a special cable with wires from a mother ship to permit communication and to supply electrici-



French fort in 1719. The name was derived from a reddened post placed near the site by Indians to mark the boundary between the territories of two tribes. The city became the state capital in 1849. After the Civil War Baton Rouge became a great commercial, rail, and shipping center.

BATTERING RAM, an ancient military engine for battering down walls. It consisted of a strong wooden beam at one end of which was a mass of iron, usually molded into the form of a ram's head. In its earlier form it was carried in the arms of men who ran with it to hit the wall. Later the ram was suspended from a beam placed on uprights, so that it could be swung to and fro. This required much less manual labor, and it had much greater mechanical force. Some of these rams had beams 100 to 150 feet long, with iron heads weighing 2 tons, and required a hundred or more men to swing them. By repeated blows from such an engine the part of a city wall attacked would in time be weakened and would finally fall with a crash, giving access to the besiegers. In its later form the battering ram was covered by a shed. This type, designed to protect the soldiers working it from the arrows and darts of the enemy, had a ram worked by ropes passing over pulleys. When the walls of a castle were attacked by a battering ram, the defenders hung out heavy pads, made of hides tied together in bundles, and wooden shields to lessen the force of the blows. They also tried to set fire to the ram and rained rocks and ar-

aken
ities.

BATTERY. A battery is a device that furnishes electric current. The first electric battery was developed by Alessandro Volta around 1800. He was led to the investigation of the nature of electricity by certain experiments performed by Luigi Galvani. Galvani had shown that when one of the nerves of a freshly killed frog was touched with a metal scalpel while an electric spark was produced on a nearby friction machine, the muscle of the frog twitched. The same effect could be produced by two pieces of metal, one of which was placed on the muscle of the frog's leg and the other on a nerve. Galvani attributed this to "animal electricity." Volta showed that this effect was not due to any "animal electricity" but was caused by the presence of two different metals. He proved his point by showing that electricity could be generated by two different metals, such as zinc

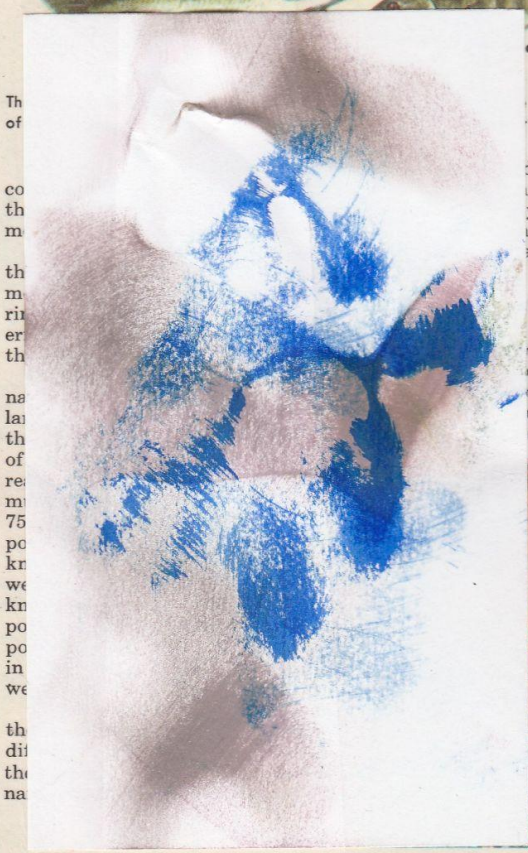
The large light-green leaves of the American basswood are lined with prominent veins.

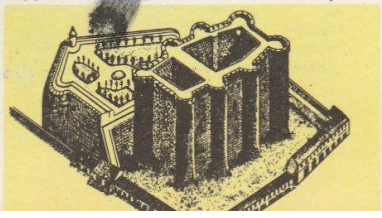
BASSWOOD, a tree closely related to the linden tree and often called linden in certain parts of the United States. It is a tall, straight tree with a tapering trunk, dark-gray fissured bark, and heart-shaped leaves. The fragrant yellowish-white flowers are attractive to bees, who from the nectar make a superior honey.

BASTILLE, a famous prison in Paris. During the ministry of Richelieu, and under the worst of the kings, people were often seized and shut up here. They were never told their offenses and were treated with great cruelty. On July 14, 1789, the Bastille was surrounded by a violent mob. The people armed with guns and cannons, stormed the Bastille, released the prisoners and demolished the building. This event marked the beginning of the French Revolution. A column stands on the site of the Bastille.

BASTILLE DAY, a national holiday of France, is celebrated on July 14. It commemorates the taking of the Bastille on July 14, 1789. Since 1889 that day has been known as the *Fête Nationale*, because the taking of the Bastille is considered the beginning of French independence. There is open-air dancing in public places; there are parades and fireworks. This French holiday is almost the same as the U.S. Fourth of July.

The Bastille was a fortified prison where opponents of the government were once kept.





BASS, SAM (1851-1878), a desperado who, with his gang, robbed stagecoaches, held up trains, and terrorized the western territories. Bass was born near Mitchell, Ind. He left home when he was 18 years old and worked in St. Louis, Mo., Rosedale, Miss., and Denton, Tex. During his first four years in Texas, Bass was industrious and was a good citizen. In 1875 [illegible] herds. After this, he and his followers held up a Union Pacific train in Nebraska. Their loot from this robbery totaled about $65,000. Later they robbed four trains in the Dallas-Fort Worth, Tex., area. Bass and his gang were for many years high on the Texas Rangers' list of most wanted criminals.

A former companion of Bass's was planted in his gang as a spy by the Texas Rangers. Information relayed [illegible] this agent to the Rangers made

Many early peoples were fine basketmakers.

BASKETWORK is the art of making containers and mats by interweaving plant stems, leaves, or fibers. It was one of primitive man's earliest and most useful handicrafts.

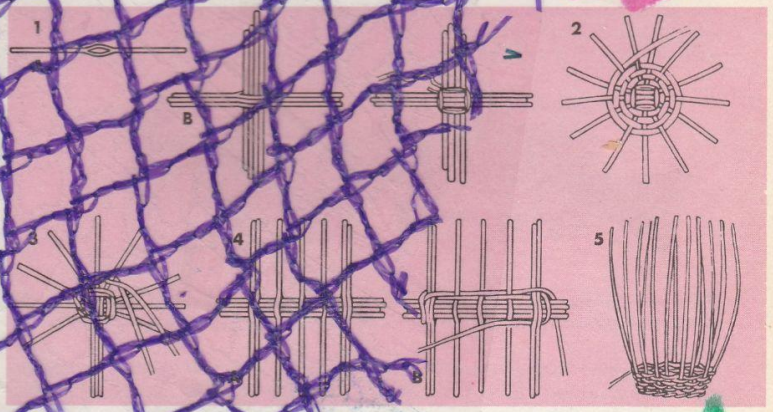
There are a number of different materials used in basketry: rattan, reed, raffia, rush, straw, hemp, willow twigs, cattail leaves, cornhusks, straw, bark, and grasses of all kinds.

The tools a basketmaker uses are a sharp knife, a strong pair of sharp shears, an awl or large knitting needle, a measuring tape, and a pail for water to moisten and soften the materials being used.

The spokes of a basket or mat are the [illegible] or upright pieces that form the framework. The weaver is the material that is wound in and out between the spokes. The spokes are usually stronger and less flexible than the weaver. The more spokes a basket has, the sturdier it will be.

Basketwork can be made more artistic by combining different weaves, by using different styles of borders, or by coloring the reeds. Reed comes in its natural color, but separate strands can be colored with [illegible] dyes before they are woven. The reeds should be soaked first in water and then in concentrated dye solution until they become the desired color. Different-colored reeds may then be interwoven and interesting patterns formed. The weaver, for instance, may be of one color and the spokes of another.

A basket or mat may also be painted after it has been completed. Before a [illegible] finish is applied, the completed object should be singed over a flame in order to remove any [illegible] fuzzies. Wood stain, enamel, [illegible]sh, wax, shellac, or lacquer may be used.



The under-and-over weave, 1 below, is the simplest; it is done with one weaver and an odd number of spokes. The double weave, 2, is the same, except that two weavers are used at once. The pairing weave, 3, is done with two weavers and either an odd or an even number of spokes. Three weavers are used for the triple-twist weave, 4. When the end of a weaver is reached, simply join another with it by crossing the ends behind a spoke, 5.

To make an open border, 1 below, trim the spokes even, cut them to a point, and push them down into the weaving. The close border, 2 and 3, is suitable for large and heavy baskets. Allow 6 to 8 spokes for each spoke end; pass each end in succession behind the one to the right, 2, over the next two behind the third, and down into the weaving, 3. When the ends have dried, trim them just inside and close to the border.

additional players have been elected to the Hall of Fame. The museum also honors men who have made an outstanding contribution to the game in other ways. This group includes umpires, managers, and baseball executives.

The annual World Series, the climax of the baseball season, has become a classic among American, and world, sporting events. (See WORLD SERIES.) Another highlight of the season is the All-Star Game, a contest in which the major leagues field teams composed of their best players. The primary purpose of the first All-Star Game was to promote Chicago's Century of Progress Exposition of 1933. Other innovations that have since become accepted as part of the institution of baseball are night games, spring training, the so-called ladies' day, and, of course, radio and television coverage of the games.

RULES

Organized baseball is played according to rules recognized by the Professional Baseball Official Rules Committee. This committee must accept any change in the playing rules before it becomes official. (The playing rules of organized baseball can be found in the *Baseball Guide and Record Book*.) During the course of a game the controlling officials are the umpires, whose decisions are final.

The object of the game is to score runs. The regulation game is nine innings, but if the score is tied at the end of the nine innings the game is continued by full innings until the

puts the ball into play from that end of the court. The officials are the referee, umpire, two timekeepers, and two scorers. The game is divided into four 10-minute quarters for amateurs and four 12-minute quarters for professionals. There are several other differences between professional and amateur basketball rules.

BARREL, a round vessel, sometimes bulging in the middle, that is longer than it is broad. Wooden barrels are made of staves bound together with hoops and have flat ends of equal size. Barrels and kegs may also be made of a metal such as aluminum or steel.

The U.S. standard measure of capacity of a barrel is 31½ gallons of liquid and 105 dry quarts.

The craft of making barrels is known as cooperage. It was known and practiced by the Romans. In the construction of a barrel, the cooper fastened together curved staves by means of hoops; each stave was widest [illegible] and tapered toward the ends. Now usually made by [illegible]

THE GOLDEN HOME AND

THE GOLDEN HOME AND HIGH SCHOOL ENCYCLOPEDIA, while sufficiently comprehensive and detailed for family use, has been created principally for students at the high school level.

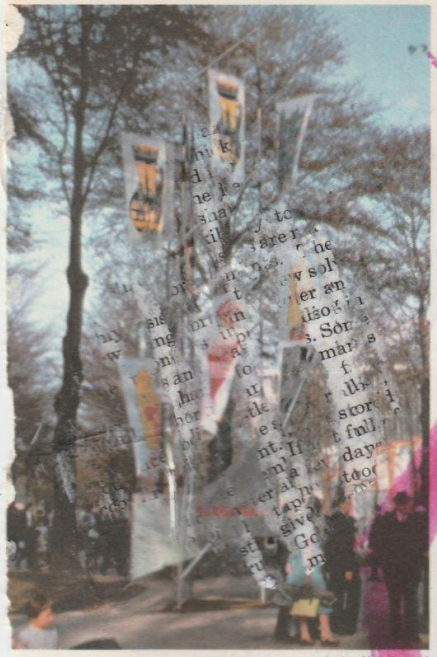
The aim of this reference work is twofold: first, to serve the student's immediate need for authoritative information on a wide range of subjects, and, second, to set forth and explain the many areas of knowledge, so that a student may explore them and thus more competently plan his educational future.

Arranged alphabetically in twenty volumes, here are thousands of full, accurate entries, written and reviewed by experts. The text is abundantly illustrated with full-color photographs and paintings.

Designed to complement the high school curriculum, this encyclopedia offers help with assignments and valuable guidance in the use of other reference tools —dictionaries, atlases, and various library materials. Extensive cross-references and a complete index direct the reader quickly to the information he seeks. A special feature of this work is the sound career information it offers in scores of job and professional fields.

Among the many subjects encompassed in these volumes are the newest developments in science, from microbiology to radioastronomy; fine arts and literature; history and government; religion and philosophy; the physical world, its plants and animals; the social sciences; invention and industry. Four-color maps and latest census figures contribute to an up-to-date view of the world, its continents, nations, and peoples.

Every care has been taken to make *The Golden Home and High School Encyclopedia* lively and stimulating, without sacrifice of accuracy. It is the hope of the editors that these volumes will be used with both advantage and pleasure.



Artha Hornbostel

Shown above is a scene from the 1958 World's Fair, held in Brussels, Belgium.

ing, scouring, roughening, and tar-spreading brushes. Lint brushes for cleaning clothes, carpets, and suede have brass wire bristles; others have plastic bristles that work by static electri[city].

The best brushes for painting houses have bristles taken from the backs of wild Chinese and Russian hogs. These bristles are known by the provinces in which they are gathered, such as Chungking, Hankow, and Siberian. In America, Chester White and Duroc hogs produce good bristles. The "flag" of a hog bristle is the split end that carries the paint. The other end of the bristle is embedded in rubber or similar material in the barrel of the brush. The tapered shape of each hog bristle gives flexibility to the whole brush. Good brushes are made from natural bristles. They are high-priced but resistant to the new synthetic cleaning agents now being used in lacquer and paint. Nylon is popular in toothbrushes and hairbrushes. Some brushes use hair from the tail and mane of horses.

A brush, like any other tool, should be used, cleaned, and stored according to its needs. If left in paint overnight or for a few days, a brush should be hung, not stood, in a can containing the proper solvent. An easy way to do this is to run a heavy piece of wire through a hole bored in the handle and rest the wire on the [rim] of the can. New brushes should be soaked in linseed oil or turpentine before using. Use turpentine; [other] natured alcohol for shellac, varnish, and lacquer.

BRUSSELS is the capital city of Belgium and the center of the country's commerce. The city lies on the Senne River. The city was once surrounded by a wall, but in the 1800's this was torn down and broad boulevards lined with rows of shade trees replaced the old town wall. The Senne River, which stands today as a canal, flows through the city. Brussels has a population of approximately 1,000,000.

Brussels is known for its splendid public buildings, palaces, and churches. Its museums, art galleries, and libraries are also well known. Brussels is a leading manufacturing city. Its chief manufactured products are chemicals, textiles, and metal goods.

Brussels was founded in the 10th century. For many years it was the capital of the Low Countries. In 1815 it took part in the revolt against Spain. When Belgium became independent in 1830, Brussels became the capital. The city was rebuilt in 1958 as the site of the World's Fair, which attracted visitors from all over the world.

BRUTUS, [illegible] (42 B.C.), one of the assassins of Julius Caesar. Brutus was a nephew of Cato the Younger. He fought on the side of Pompey the Great against Caesar in the civil war; but after the battle of Pharsalus (48 B.C.) Brutus made his peace with Caesar and accepted many honors and favors from him. Others did not trust Caesar, but Brutus believed that Caesar would not make himself a king. Therefore Cassius in the plot to take Caesar's life and was one of those who stabbed him.

After the murder of Caesar, Brutus fled to Macedonia, where he raised a large army to fight Antony and Octavius (Augustus Caesar). The armies met at Philippi, where two battles were fought. Cassius stabbed himself after the first battle, and Brutus died in the same way after the second one, 20 days later. When his wife, Portia, heard of his death, she also killed herself. Brutus is one of the principal characters in Shakespeare's play *Julius Caesar*.

Brutus, one of Caesar's murderers

[WILLIAM] JENNINGS (1860–1925), an American politician known as The Commoner, was born at Salem, Ill. He was graduated in 1881 from Illinois College, Jacksonville, with the highest honors of his class; he received the degree of LL.B. in 1883 from the Union College of Law, Chicago. After practicing law at Jacksonville, Ill., and at Lincoln, Neb., he represented the First District of Nebraska in Congress from 1891 to 1895. In 1896 he was the Democratic nominee for president of the United States but received only 176 electoral votes against 271 for William McKinley. In 1898 he raised a regiment of volunteers in Nebraska for the Spanish-American War and was elected its colonel, but he saw no active service. He was again nominated for the presidency in 1900 but received only 155 votes against 292 for McKinley. [illegible] he established at [illegible] tical paper en-

Paid for an[illegible]

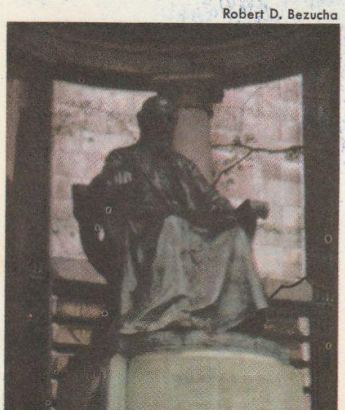
titled the *Commoner*. In 1906 he made a tour of the world, and in 1908 he was for the third time the Democratic candidate for president but received only 162 votes against 321 for William Howard Taft. President Wilson appointed him secretary of state, Mar. 4, 1913, from which office he resigned Jan. 9, 1915. A strong supporter of prohibition, he exerted all his influence in favor of the adoption of the 18th Amendment to the Constitution. Bryan was the chief counsel for the prosecution in the trial of John T. Scopes for teaching evolution in the high school at Dayton, Tenn.; Clarence Darrow was the counsel for Scopes, who was convicted and fined.

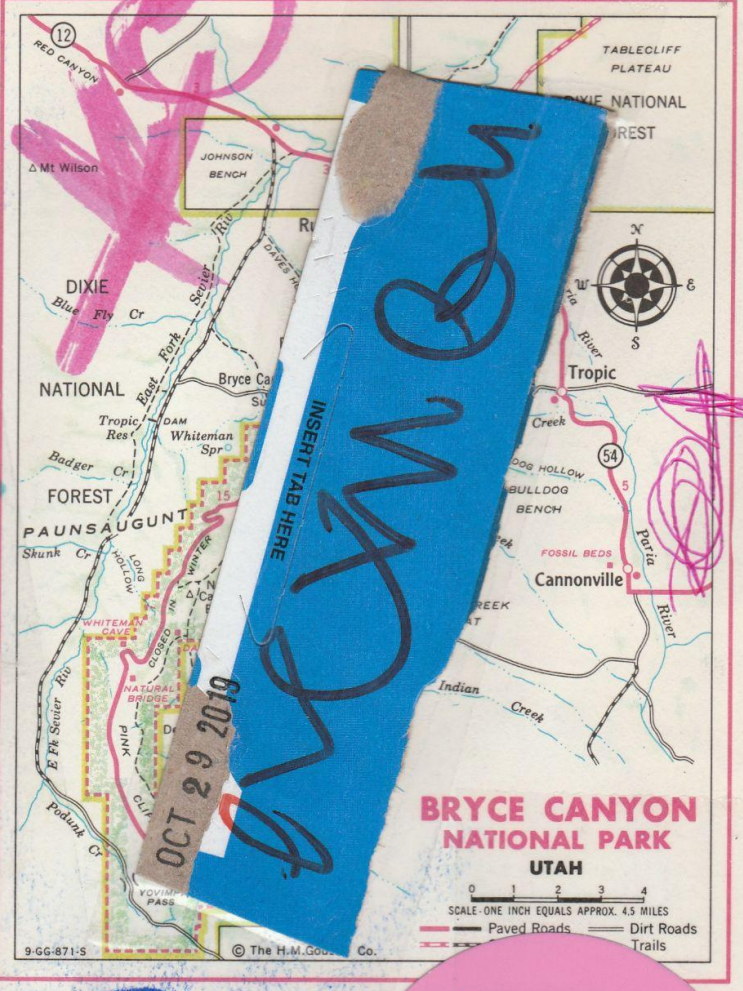
BRYANT, WILLIAM CULLEN (1794-1878), the first major American poet, was born in Cummington, Mass. When he was 10 he wrote poetry. At 13 he published a long poem called "The Spanish Revolution." He was admitted to the bar in 1815 but soon began to study for a literary life. He went to Williams College but left after a year. He published two poems which were printed in 1808 when he was 13 years old. In 1821 he published a volume of poems that brought him fame. In 1825 he went to New York City to live. A year later he became editor of the *Evening Post*, a newspaper with which he was connected for the rest of his life. He traveled both at home and abroad, and became acquainted himself with the literature of all the principal nations of Europe.

Primarily a nature poet, Bryant wrote in a simple, restrained, and dignified style. Among his best-known poems are "To a Waterfowl," "To a Fringed Gentian," and "Mutation." He died in New York.

This statue in New York City was erected in honor of the poet William Cullen Bryant.

Robert D. Bezucha



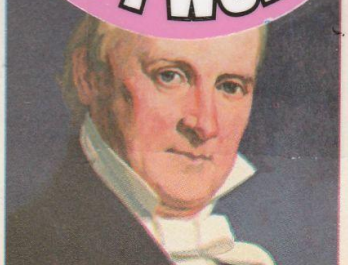


Bryce Canyon National Park was named for its ho... This map shows the location of the numerous sight...

BRYCE CANYON NATIONAL PARK in southwestern Utah includes some of the most interesting exposures of the Pink Cliffs formation. It is filled with rock pinnacles of many shapes and bright colors. The park covers more than 36,000 acres. It was established in 1928.

In reality Bryce is not a canyon. It is a group of horseshoe-shaped amphitheaters cut by water erosion into a plateau. It extends down 1,000 feet through its pink and white marly limestone. The largest amphitheater is 3 miles long and about 2 miles wide. It is filled with myriads of fantastic figures cut by weathering influences.

BTU. See BRITISH THERMAL UNIT.



BRUCE, ROBERT THE (1274-1329), of Robert I, king of Scotland, called the Bruce, was the hero of Scotland's war for independence from England.

Robert the Bruce was born probably at Turnberry Castle in Ayr. His grandfather laid claim to the Scottish crown, but the English king, Edward I, supported another claimant, John Baliol. In 1296 Robert and his father did homage to the English king, who took the crown of Scotland himself. But shortly after, Robert repudiated this homage and joined the Scottish patriot and rebel William Wallace. After Wallace was captured and put to death by the English, the Scots continued their war of independence under Robert the Bruce, who was crowned king of Scotland in 1306.

During the first years of his reign the English were victorious and drove Robert out of Scotland. But Robert's valiant generalship and Scottish patriotism triumphed over the English in the decisive Battle of Bannockburn, on June 24, 1314. The English, however, refused to recognize Robert as king or the independence of Scotland until the Treaty of Northampton in 1328. Robert proved himself an able administrator, established a stable government in Scotland, and gained the recognition of his country by foreign governments.

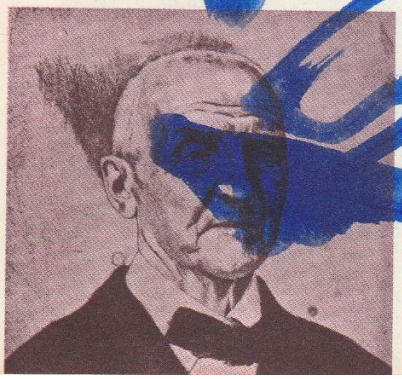
BRUCELLOSIS. See UNDULANT FEVER.

BRUCKNER, ANTON (1824-1896), Austrian composer, was born at Ansfelden, the son of a schoolmaster. Bruckner showed remarkable musical talent when a child, but he received no expert instruction in music until he was 11 years old. He was then instructed in the organ and in harmony. From 1837 to 1840 he was a choir boy at St. Florian's monastery. Bruckner continued his musical education, and in 1845 he was given an appointment at St. Florian's. In 1851 he became organist for that institution.

Bruckner's first notable work was his Requiem in D Minor. From 1855 to 1861 he studied musical theory with Simon Sechter, a Viennese professor of counterpoint. In 1856 Bruckner won an open competition for organist at the Cathedral of Linz, a post he kept until 1868. In 1865 he met Wagner, who influenced Bruckner's further development. Bruckner's first mature work was his Mass in D Minor of 1864. In that same year appeared his Symphony in D Minor. The demands of composing these works forced Bruckner's breakdown. He quickly recovered and in gratitude composed his Mass in F Minor.

In 1868 Bruckner settled in Vienna and there faced great hostility. Until 1881, when Hans Richter conducted Bruckner's Fourth Symphony, Bruckner was boycotted by conductors. After that, however, he attained great fame in both Europe and America. In addition to his religious works, his Symphony in F Minor, and his Symphony in D Minor, Bruckner wrote nine other symphonies, the last of which was unfinished at his death.

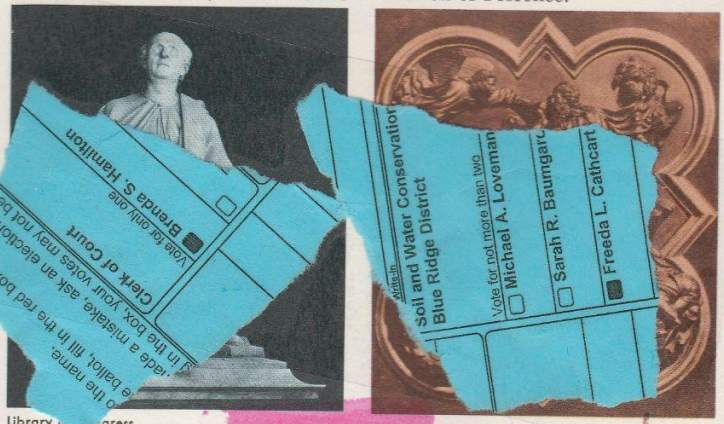
Anton Bruckner, romantic composer. Photo, Brown Bros.



BRUISE. A bruise is caused by an injury that breaks the small blood vessels in the tissues just under the skin. As the blood oozes into the tissues from these broken vessels, it causes swelling and discoloration, as in the familiar "black eye." Usually no treatment is needed. Ice or cloths wrung out of very cold water, when applied immediately, help to prevent discoloration, to keep down the swelling, and to relieve the pain.

BRUNELLESCHI, FILIPPO (1377-1446), an Italian architect, was born in Florence. He received a good general education and then learned the goldsmith's art. For a time also he studied sculpture and was considered one of the leading sculptors of Florence, but he finally adopted architecture as his chief profession.

He was chosen in 1407 to undertake the completion of the famous Cathedral in Florence, which had been designed by Arnolfo di Cambio. It had no dome. No one at the time had built a large dome, and the construction was not understood. Brunelleschi built a cupola, known as one of the greatest architectural works in existence. He also built the Pitti Palace and the church of St. Lorenzo in Florence. He was for a long time a member of the Supreme Council of Florence.



Library of Congress

The artist, sculptor, and architect Brunelleschi was one of the pioneers of Renaissance art. A statue of him and a decorative panel made by him are shown above. Much of his work was inspired by his study of the remains of Greek and Roman art so plentiful in Italy.

BRUSH, a device consisting of metal, fiber, or hair bristles set in a handle. A paintbrush applies material, a wire brush removes it, and a hairbrush arranges it. Brushes should be kept clean and should never rest on their bristles.

Scouring brushes, both hand and power driven, are used in garages to remove carbon and rust, in house painting to remove dirt and loose paint, in finishing masonry, in roughening surfaces before the application of stucco, and in floor cleaning in preparation for varnishing and painting. On a 2-inch long polishing brush with a diameter of 1½ inches there may be as many as 242,144 soft steel bristles .006 inch thick. The wire bristles of coarse cleaning brushes are much thicker. Brass, aluminum, and coarse fibers such as tampico are also set in clean-

Ram-shaped clay relic of the Bronze Age.

BRONZE AGE, the age in the history of man during which he made bronze implements. The Bronze Age came after the Stone Age and before the Iron Age. Yet we cannot draw a distinct line between these ages. The Australian aborigines, for example, never reached the Bronze Age. And the Aztecs and Incas were still in the Bronze Age when the Europeans had reached the Age of Iron.

Man probably began to use cop-

of radio
means of electric
casting began about 1920,
vision, about 1940. Both types of programs are put on for entertainment or for the dissemination of information.

Since broadcasting is designed for the general public, international agreements had to be drawn up to prevent radiation interference between national stations. Domestic broadcasting was assigned to long-wave and medium-wave bands in the radio spectrum; and international broadcasting, to short-wave frequency.

Radio rehearsals and performances take place in studios. The speakers talk into microphones that are connected to the control room. Here, operators adjust the level of electrical currents and route incoming programs to different senders. Senders are linked to receiving sets that control station, volume, and tone as the listener chooses. Television broadcasting operates in much the same way. Performers act before cameras (microphones for sound pickup are placed outside camera range) that generate video signals. Eventually these signals are reconverted to visual images and adjusted on the screens of receiving sets as the viewers please.

Broadcast technicians watch dials and monitors in a television control room. They must keep all equipment functioning properly.

pean countries the government sponsors most of the radio and television broadcasting by means of license taxes on receiving sets.

BROGLIE, LOUIS VICTOR DE (1892-), French physicist, born in Dieppe. He studied at the University of Paris and later became a lecturer there. In 1933 he was appointed professor of theoretical physics at the Henri Poincaré Institute of the University of Paris. He did research on the quantum theory and became noted for his wave theory of matter. In 1929 he was awarded the Nobel prize in physics.

BROMINE, symbol Br, is a dark-red liquid, about three times as dense as water. It is very dangerous to handle as it inflicts terrible burns. The fumes from it are poisonously irritating to the eyes and breathing organs. It is one of the only two elements that are liquid at room temperature—mercury is the other one.

Bromine was discovered over a century ago by a French chemist while he was crystallizing salt from sea water. It has since been found to be present in small quantities in all sea water and in most mineral springs.

The salts of bromine are called bromides, and several of them are commercially valuable. Potassium bromide is used by doctors as a sedative. Silver bromide is used for sensitizing photographic plates, because it is decomposed by light, and ethylene dibromide is used in making antiknock gasoline for automobiles. Xylyl bromide and bromo-acetone are used to make tear gas for war or police purposes. In certain insecticides methyl bromide is used.

Bromine is extracted as a by-product from salt wells in Michigan, Ohio, West Virginia, and California. It can also be extracted from sea water.

BRONTË, the name of a famous English family that produced three important novelists of the 19th century.

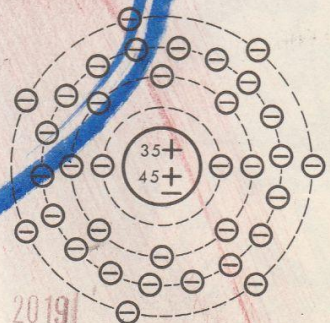
Charlotte (pseudonym Currer Bell) was born in Thornton, Yorkshire, in 1816. She was the eldest daughter of Patrick Brontë, a well-educated clergyman of Irish extraction, and was the sister of Branwell, Emily, and Anne Brontë.

The children were reared by their aunt in the parsonage at Haworth, Yorkshire, after the death of their mother. All of them showed a precocious talent for imaginative writing. Charlotte studied at the Cowan Bridge school for children of poor clergymen, as did Emily. They also trained as governesses at Miss Wooler's school in Dewsbury.

Charlotte conceived a plan to establish a school run by the three girls. When her aunt died, she was forced to give up the plan. She then turned to literature. She contributed 19 verses to *Poems, by Currer, Ellis, and Acton Bell* and completed her first novel, *The Professor*. In 1847 her novel *Jane Eyre* was published and became an immediate success. In it Charlotte bitterly depicted her school as a grim, although charitable, institution. She believed that the school's poor conditions led to her sisters' deaths.

After the deaths of her brother and her sisters, she became saddened and lonely. She visited London and made friends among the

In this diagram of a bromine atom the 35 electrons (−) are arranged around the nucleus, containing 35 protons (+). Thus bromine has atomic number 35. In the radioactive isotope shown here (atomic weight 80), the nucleus also contains 45 neutrons.



literary crowd [illegible] a few months aft[illegible] mar[illegible] to her father's [illegible]te in 1855.

Emily [illegible]**ne** (pseudonym [illegible] Bell) was al[illegible] born in Thornton, York-shire, [illegible] 1818. [illegible]er only [illegible]vel, *Wuthering Heights*, is consider[illegible] by some [illegible]ics to be a master[illegible]ce. Others have thought she was the only sist[illegible] with a real poetic talent. Her novel [illegible] published in 1847, and a year later she died from tuberculosis.

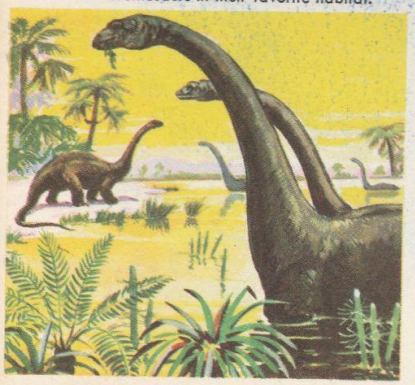
Anne (pseudonym Acton Bell), [illegible]

lived during the Jurassic. See DINOSAUR; GEOLOGIC TIME SCALE.

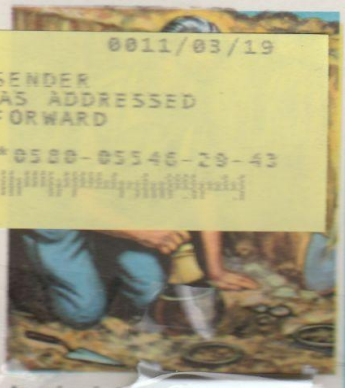
Brontosaurs were 65 to 80 feet long and weighed 30 to 40 tons. They had long, slender necks, small heads, short, heavy bodies, thick, straight legs, and long tails. The tail was massive near the hips but tapered to a whiplash. They walked on four feet. The hindlegs of brontosaurs were longer and more massive than the front legs. Brontosaurs had tiny brains and were slow moving and sluggish.

Brontosaurs lived in tropical, swampy areas and ate green plants in large quantities. Because of their tremendous sizes, brontosaurs probably found it difficult to walk on dry land. They spent much of their time wading about in shallow water. (If a reptile doubles its size, its weight is eight times as great, but its legs are only four times as strong. After the reptile reaches a certain size, its legs are not able to support the weight of its body. If the reptile wades partially submerged in water, the water supports part of the body weight.)

Brontosaurs in their favorite habitat.



Above are shown a piece of jewelry and two knives dating from [illegible]nze Age. When people first discovered how to make bronze, they modeled the tools th[illegible]e from it on their old stone tools. As they became more experienced with the new alloy, [illegible]odified and improved the bronze tools. Pots were also made from bronze, which re[illegible] highly useful metal.



An archaeologist [illegible] which was brought [illegible] some [illegible] LIFT & REMOVE [illegible] pictures at right.

BRONZE is a copper-base alloy. In true bronze, tin is the main alloying element, but the meaning of the word has been broadened to include all copper-base alloys containing zinc or alloying elements other than zinc if those elements are in sufficient amounts to be predominant over the zinc in the alloy.

Bronze was known to, and used by, the ancient Assyrians and Egyptians. Indeed, one period of prehistoric time is known as the Bronze Age. Late in the Stone Age, man in the Near East began to make some use of copper. The discovery that tin could be combined with molten copper to form a new and stronger metal led to the opening of trade routes in search of ores. By 2500 B.C., Egypt and Mesopotamia were leaders in a new civilization.

Bronze today has many important industrial uses. In its earliest forms it was also undoubtedly employed for the manufacture of tools and implements, but modern man knows most about ancient bronze because of its wide use in art and ornament. Examples are Egyptian, Assyrian, and ancient Chinese statues, utensils, and ornaments.

Bronze was the favorite material used by the Greeks and Romans for their many public monuments because hollow figures made of this metal were light in weight, resisted deterioration through exposure, and had a pleasing color and luster. Bronze may vary from a reddish brown to yellow, or even silver, according to the proportions of the alloy and the purity of the alloying elements.
